Description

The PLD-CW-2000/PLD-CW-2000-ZIF is a constant current laser diode driver for powering 10/14-pin butterfly laser diode modules for applications, which require precision low ripple constant current regulation.

The driver circuitry operates from a single 5Vdc power source. The driver supplies a bidirectional proportional-integral-derivative (PID) thermoelectric cooler controller (TEC) with current capability of 4A and voltage capability of 4V.

The main parameters of PLD-CW-2000/PLD-CW-2000-ZIF (output current, temperature set, monitor photodiode signal) are controlled

by computer interface. The GUI can control multiple drivers connected by CAN/USB hub.

The driver supports full amplitude modulation of drive current by an external analog 0...5V and TTL signals.

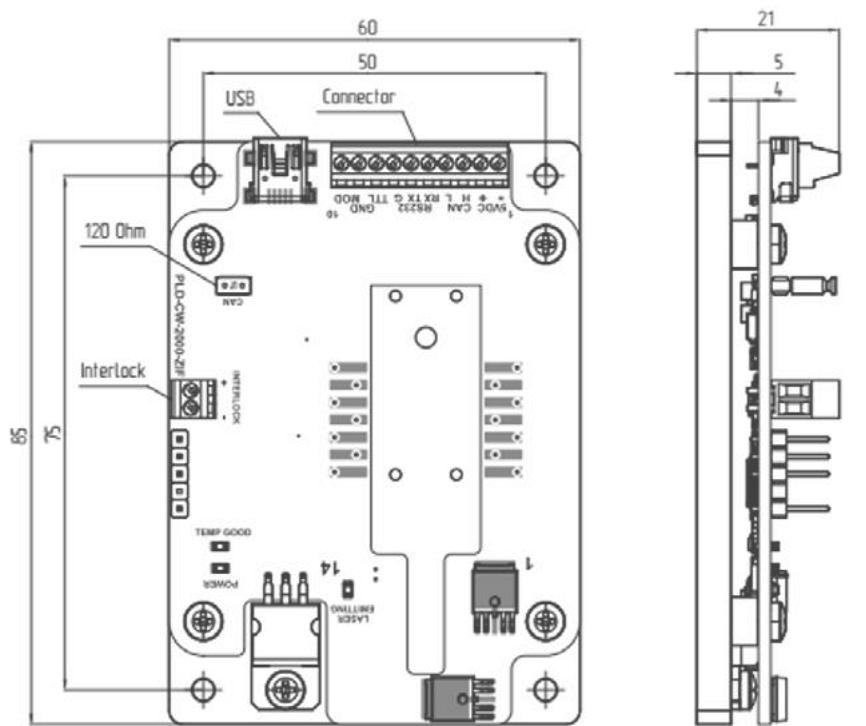

Driver has landing pads for soldering a butterfly laser diode directly into driver board and large heat sink for stable heat dissipation.

Interface connector pinout

PIN	Function	Description
1	GND	Device ground
2	+5VDC	Power input
3	CANH	CAN bus high
4	CANL	CAN bus low
5	RS232 RX	RS232 interface port RX
6	RS232 TX	RS232 interface port TX
7	GND	Device ground
8	TTL	Trigger input. Connect to the external TTL signal generator for triggering output current. The amplitude of external trigger must be 3.3 V to 5 V range. Input impedance is 500 Ω. Choose “External” mode by PC software and press “ON/OFF” button to activate triggering output current by external input. Current amplitude sets by PC software. Maximum frequency of external triggering signal is 3 kHz.
9	GND	Device ground
10	MOD	Analog modulation input. Connect to the external analog voltage or external sinusoidal signal generator for control output current. 0÷5 V analog input corresponds to 0÷2 A output current. Current setpoint is 400 mA/V. Input impedance is 400 Ω. Choose “ANALOG” mode by PC software and press “ON/OFF” button to activate output current and control it by analog input. Maximum frequency of external sinusoidal signal is 3 kHz, that supports 2 A modulation amplitude. The modulation amplitude gets smaller at higher frequency.

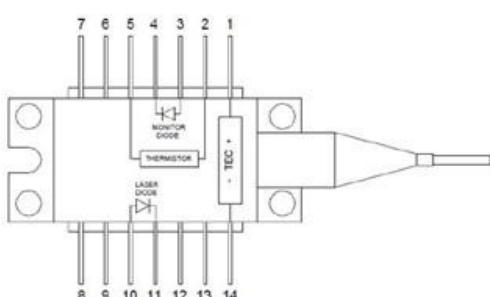

INTERLOCK

Connect to the external interlock circuit. Open: device is locked. Closed: device is operational. Internally pulled up to 3.3 V by 1 kΩ resistor. Use open collector or dry contact.

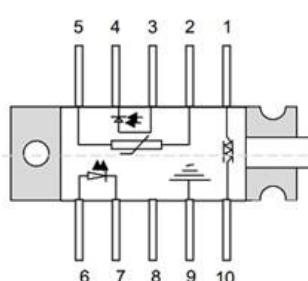

Note: The laser emission can only be started when the interlock circuit is closed
